

Week 3: Reading, Practice Problems, and Homework Exercises

Reminder

Your submitted homework solutions should show not only your answers, but should show a clearly reasoned logical argument, written using **complete English sentences**, leading to that solution. Each mathematical symbol that you will encounter stands for one or more English words¹, and if you elect to use any symbols, you should do so *only* in full sentences where you intend to abbreviate words.

If the work that you submit is incomplete or illegible, you will not receive credit for it. An example of acceptable homework solutions is posted on myWPI under “Course Materials”.

Reading

Please read Section 5.5 in time for Tuesday’s lecture, and Section 5.6 in time for Thursday’s lecture. (In-class students, you can always re-watch the lectures online after you finish your reading, if it would benefit you.) I will not necessarily cover all of this material in class, but you will be responsible for it. Any questions about any of the material can be addressed in class or office hours, or to me via e-mail (emkiley@wpi.edu).

Questions to Guide Your Review

Note: Do not hand these in!

Please find at the end of each chapter, before the chapter problems are given, the “Questions to Guide Your Review” section. You should read through these items to check your understanding of the chapter, but you are not required to hand in your answers. If you have questions about these, you will usually be able to find your answer by re-reading the section, by consulting the hints in the back of the book, or, if you are really stuck, by consulting me. These are meant to be conceptually important questions for you to check how well you have understood the material in each section, and if you expect to do well on the midterm and final exams, I suggest studying these in particular.

The relevant questions for this week’s material are:

- Chapter 6, “Questions to Guide Your Review”, p. 415, Problems 1, 2, 4, 5

Practice Problems

Note: Do not hand these in!

Here are some practice problems to work on at home. It is extremely important that you are proficient at exercises such as these; without the basic skills, you will find it difficult to complete your exams in the allotted time.

You will find the answers to the odd-numbered problems in the back of the book. This is useful if you want to check your work, but please remember that the *logical argument*, not the final answer, is the most important part of solving a problem for credit in this class. You should therefore understand *how to solve* each of these problems. In particular, you should *not* be satisfied with merely looking up the solution in the back of the book.

Please discuss any questions with me in class, during my office hours, or send me an e-mail.

- Section 6.1, Problems 1–49 odd
- Section 6.3, Problems 1–25 odd; 26
- Section 6.4, Problems 5–17 odd

¹See a list of mathematical symbols and their meanings here: http://en.wikipedia.org/wiki/List_of_mathematical_symbols

Week 6: Homework Problems

Due date: Monday, June 6, 2015, 11:59 p.m. EDT. Please upload a .pdf version to myWPI (my.wpi.edu).

Rules for Calculus Assignments:

- I) Each student must compose his or her assignments independently. However, brainstorming may be done in groups.
- II) Please typeset your solutions using L^AT_EX, or handwrite them neatly and legibly using correct English.
- III) Show your work. Explain your answers using **full English sentences**.
- IV) **No late assignments will be accepted for credit.**

Problem 1. [10 points] Use a definite integral to verify the familiar formula $V = \frac{1}{3}\pi r^2 h$ for the volume of a right circular cone with base radius r and height h .

Problem 2. [10 points] A manufacturer needs to make corrugated metal sheets 36 inches wide with cross-sections in the shape of the curve $y = \frac{1}{2} \sin(\pi x)$, for $0 \leq x \leq 36$. How wide must the original flat sheets be, in order for the manufacturer to produce these corrugated sheets?

Problem 3. The astroid shown in the figure below has equation $x^{2/3} + y^{2/3} = 1$.

(a) [5 points] Find the total length of the astroid.

(b) [5 points] Find the area of the surface of revolution generated by rotating the astroid around the y -axis.
